

Los Altos Games Comparison

Here's the comparison between the last Los Altos game and the most recent one:

Statistically, **we performed better this time around by virtually every metric** (see graph below) - we had more shots taken, more crosses, more successful passes, and more possession. Although we still possessed the ball less than Los Altos (we only had possession 47.8% of the time) this game, we possessed it more than in the last game (40.9% of the time).

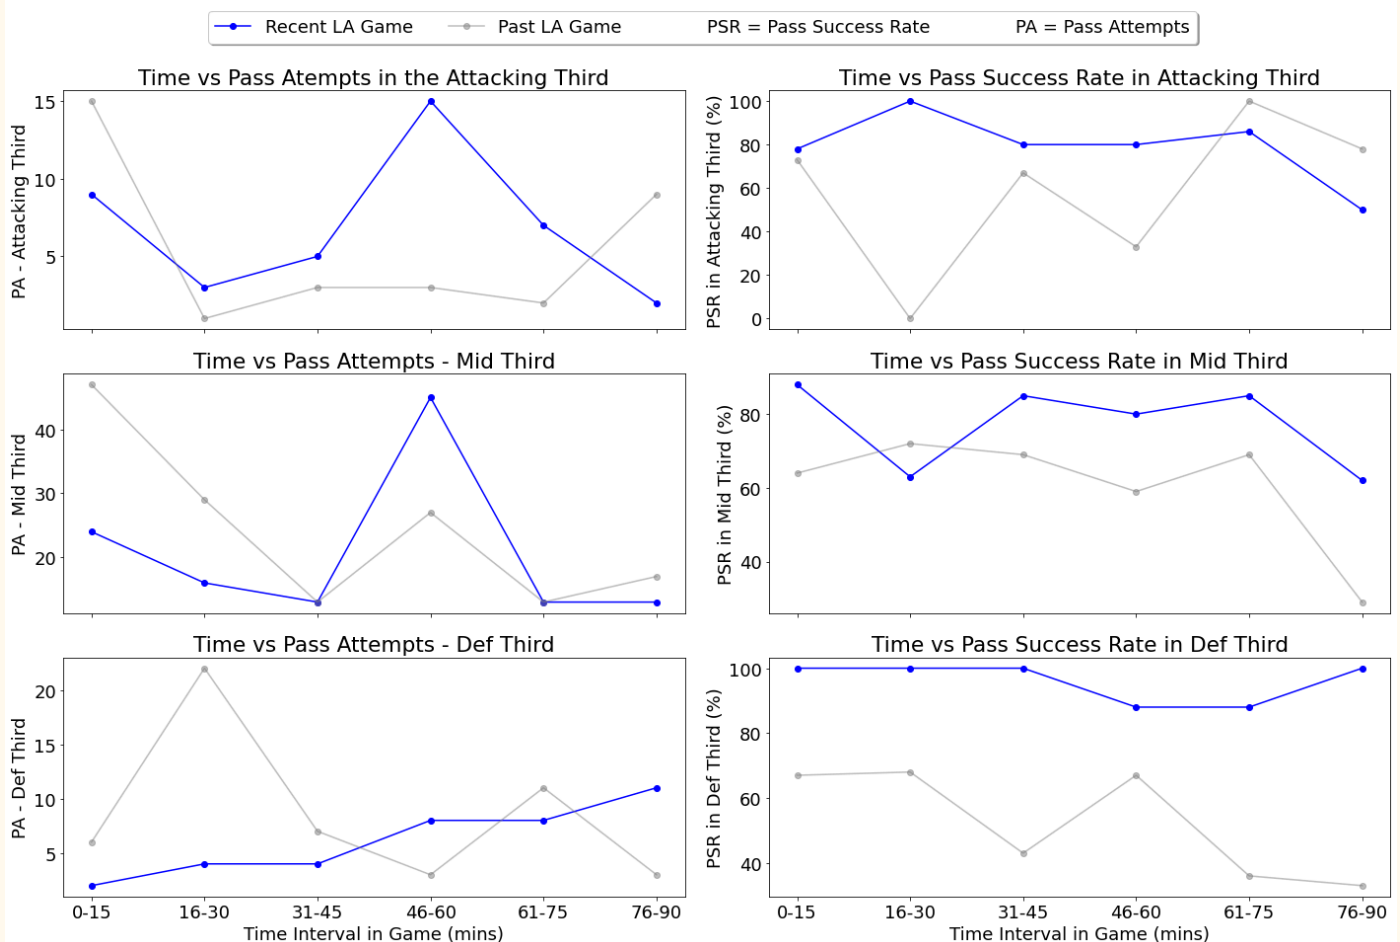

We also showed better consistency across the pitch (see graph below).

Specifically defensively, the high pass success rate, even during intervals where Los Altos managed to score, suggests that the goals conceded were less a product of systemic defensive lapses and more a result of Los Altos's ability to capitalize on their opportunities. Once we regained possession, we mostly maintained control (at least until we got it out of the defensive third). It might be worth figuring out **what situation vulnerabilities / one-off mistakes are leaving us open to get scored on.**

On the attacking front, we connected better, but our one goal still came from PKs, suggesting that **we're not maximizing the opportunities we get.**

Specific Pass Comparisons for both LA Games

All in all, the general pattern seems to be that we did improve greatly since the last game - the reason we lost was most likely due to external factors such as a greater improvement in Los Altos's gameplay, different reffing, and just inherent variability in play.
